HYBRID QUANTUM COMPUTING NEURAL NETWORK ON PREDICTING DIABETES USING PIMA INDIAN DIABETES DATASET

NAME: Minnushaa. A. A

REG NO: 23MIS1035

ABSTRACT:

This report presents a hybrid quantum-classical neural network (QNN) for binary classification of diabetes using the Pima Indians Diabetes Dataset. The quantum component employs angle encoding on 8 qubits, executed on IBM's real 156-qubit ibm_fez processor via PennyLane and Qiskit. Classical post-processing uses a PyTorch MLP.

Key achievements:

- **~100+ real quantum jobs** submitted to IBM Quantum Workloads (tagged "Diabetes1").

- **Quantum accuracy**: 72% (limited by hardware noise).

- **Classical baseline:** 78% (for comparison).

- **Proof-of-concept:** Demonstrates end-to-end hybrid QML on noisy intermediate-scale quantum (NISQ) hardware.

This work highlights the feasibility of quantum-enhanced ML for healthcare, paving the way for fault-tolerant quantum advantages.

1. INTRODUCTION

Quantum machine learning (QML) promises exponential speedups for classification tasks by leveraging quantum superposition and entanglement. However, current NISQ devices face noise challenges. This project implements a **hybrid QNN** that combines quantum feature encoding with classical optimization, applied to diabetes prediction—a critical healthcare problem affecting 422 million people globally.

Contributions:

- Real execution on ibm_fez.

- Comparison of quantum vs. classical performance.

- Open-source Colab notebook for reproducibility.

2. DATASET & PREPROCESSING

Pima Indians Diabetes Dataset

- **Samples:** 768

- **Features:** 8 (Pregnancies, Glucose, BloodPressure, SkinThickness, Insulin, BMI, DiabetesPedigreeFunction, Age)

- **Target:** Binary (Outcome: 0=No Diabetes, 1=Diabetes)

- **Class Distribution:** 65% No Diabetes, 35% Diabetes

3. CODES

1) Install everything silently (no progress bars) and then verify that every package is importable.

 # 1. Install everything

```
!pip install -q --no-cache-dir \
    pennylane \
    pennylane-qiskit \
    qiskit-ibm-runtime \
    torch \
    scikit-learn \
    pandas \
    numpy \
    matplotlib \
    seaborn
```

 # 2. Verify imports

```
import pennylane as qml
import pennylane_qiskit
import qiskit_ibm_runtime
import torch
import torch.nn as nn
import torch.optim as optim
import sklearn
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns

print("All packages imported successfully!")
print(f"PennyLane version : {qml.__version__}")
print(f"Torch version     : {torch.__version__}")
print(f"scikit-learn      : {sklearn.__version__}")
```

2) **IBM Quantum Authentication:**

Authenticate the IBM quantum and save the account.

```
from qiskit_ibm_runtime import QiskitRuntimeService

# Your keys (correct format)
IBM_TOKEN = "_IKeJ0V_iOD-xftJCZTmkqsfzhaqcxNc1_eJYA2Mxe6M"
INSTANCE_CRN = "crn:v1:bluemix:public:quantum-computing:us-east:a/8d98786ce16846079da3847846d8595f:88de2768-ef90-41d8-8bf7-ad623c7598d9::"

# CORRECT CHANNEL: 'ibm_quantum_platform'
QiskitRuntimeService.save_account(
    channel="ibm_quantum_platform",    # Fixed here
    token=IBM_TOKEN,
    instance=INSTANCE_CRN,
    overwrite=True
)

print("IBM Quantum account saved successfully!")
```

3) **Load & Preprocess Diabetes Dataset**

```
# === LOAD & PREPROCESS DIABETES DATASET ===
import pandas as pd
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import StandardScaler
from torch.utils.data import TensorDataset
import torch

url = "https://raw.githubusercontent.com/jbrownlee/Datasets/master/pima-indians-diabetes.csv"
names = ['Pregnancies', 'Glucose', 'BloodPressure', 'SkinThickness',
         'Insulin', 'BMI', 'DiabetesPedigree', 'Age', 'Outcome']
data = pd.read_csv(url, names=names)
X = data.drop('Outcome', axis=1).values.astype(np.float32)
y = data['Outcome'].values.astype(np.int64)
```

```
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, stratify=y, random_state=42)
scaler = StandardScaler()
X_train = scaler.fit_transform(X_train)
X_test = scaler.transform(X_test)

# === CREATE TORCH DATASETS ===
train_ds = TensorDataset(torch.from_numpy(X_train), torch.from_numpy(y_train))
test_ds = TensorDataset(torch.from_numpy(X_test), torch.from_numpy(y_test))
print(f"Train samples: {len(train_ds)} | Test samples: {len(test_ds)}")
print("train_ds and test_ds are READY!")
```

4) **Works With Ibm_Fez - Connect To Ibm Quantum - Pick Ibm_Fez (156 Qubits) - Create Pennylane Device - Define Circuit**

```
#WORKS WITH ibm_fez
import pennylane as qml
from qiskit_ibm_runtime import QiskitRuntimeService
import torch
n_qubits = X_train.shape[1]  # 8
shots = 1024

# CONNECT TO IBM QUANTUM ====
service = QiskitRuntimeService()
print("=== YOUR IBM BACKENDS ===")
backends = service.backends()
for b in backends[:3]:
    sim = " (SIM)" if b.configuration().simulator else " (REAL)"
    print(f" • {b.name}{sim} | Qubits: {b.configuration().n_qubits}")

# === PICK ibm_fez (156 qubits) ===
backend = service.backend("ibm_fez")
print(f"\nSelected: {backend.name} | Qubits: {backend.configuration().n_qubits}")
```

```
# === CREATE PENNYLANE DEVICE
dev = qml.device(
    "qiskit.remote",
    wires=n_qubits,
    shots=shots,
    backend=backend)
print(f"Device ready: {dev.name} | Backend: {backend.name}")
# === DEFINE CIRCUIT ===
@qml.qnode(dev, interface="torch")
def quantum_circuit(inputs, weights):
    for i in range(n_qubits):
        qml.RX(inputs[i], wires=i)
    for i in range(n_qubits):
        qml.RY(weights[i], wires=i)
    for i in range(n_qubits - 1):
        qml.CZ(wires=[i, i + 1])
    return [qml.expval(qml.PauliZ(i)) for i in range(n_qubits)]

# === TEST CIRCUIT (FIX: convert list → tensor) ===
test_in = torch.tensor(X_train[0], dtype=torch.float32)
test_w = torch.randn(n_qubits)
print("Running test circuit on ibm_fez... (this will submit a job)")
result = quantum_circuit(test_in, test_w)

# FIX: result is list → convert to tensor
result_tensor = torch.tensor(result)
print(f"Test OK: {len(result_tensor)} measurements")
print(f"Sample: {result_tensor[:3].tolist()}")
```

5) **Run Real Quantum Training On Ibm_Fez - Submit Real Jobs To IBM Workloads - Show Accuracy, Loss, Confusion Matrix - Suppress All Warnings**

```
# === HYBRID QNN MODEL ===
class HybridQNN(nn.Module):
    def __init__(self, n_qubits):
        super().__init__()
